

Breaking down barriers

Going beyond clinical care to address underlying barriers to patient health.

You know there's more to your patients' overall well-being than their physical health. But, there's also more to addressing their overall well-being than the choices they make and the clinical care you provide. Social determinants of health – the conditions of the environment in which patients are born, live, learn, work, play and worship – play a key role in their ability to get and stay well.¹

Factors other than clinical care can account for over **80%** of health outcomes.²

See the impact on a seemingly simple health behavior, such as taking a prescribed medication.

Despite the significant impact on health behaviors and outcomes:

Only **15%** of physician practices are screening patients for key social needs.³

How are you addressing social determinants of health among your patients?

By identifying and understanding these challenges among your patients, you can provide a deeper level of support to guide them to better health. CareAllies is here to help.
